

NEWS RELEASE:

For immediate release:

Access International Opens Dot™ Micro-Wireless Platform to Developers
Interface to Spur Growth in Enterprise Wireless Auto ID, Locating, Sensing and Protection Applications

DALLAS, TX, February 6, 2008 – [Access International Inc.](#) (OTCBB: AXSI), a leading provider of wireless business activity monitoring solutions, today announced the opening of its new [Dot™](#) micro-wireless technology to developers for building applications to enable wireless communications from all things in the enterprise. Dots are ultra small, battery powered wireless computers embedded into or attached to things such as [ID cards](#), [assets](#) and [vehicles](#) enabling them to be automatically identified, located, counted and sensed. Micro-wireless communications operate over a separate frequency band so as not to interfere with corporate wireless networks but to interface seamlessly and complement those networks by making it easy to add enterprise applications for enhanced productivity, security and safety. A developer's kit, available royalty free to licensed registered developers, is expected to add to the already broad use of Dot technology to tap into new sources of real-time information in the enterprise.

"We are happy to respond to market demand for access to our new Dot micro-wireless platform," stated [Allan Griebenow](#), President and CEO of Access International. "With more than twenty-five separate uses already, we have a great deal of experience in enabling vendors of all kinds to easily add new sources of wireless data for improved efficiency, productivity, security and safety. We expect the Dot-ting of the enterprise to make all things in the enterprise wireless enabled, and opening up our system demonstrates our commitment to that goal."

Third party developers have already built numerous interfaces that connect seamlessly into the largest and most critical legacy enterprise systems. These include security access control and fire and burglary systems, enterprise-wide database systems, Enterprise Resource Planning (ERP), automated Workforce Management systems (WFM), accounting and inventory systems, contractor time and attendance systems, asset management systems and Environmental Health and Safety (EHS) systems. The development of an interface to capture data transmitted by the [Dot](#) micro-wireless system typically takes just a few days. The kit includes documentation in the form of an Application Program Interface (API) and software to emulate the hardware system. Demonstration kits including the actual Dot hardware are available for a small fee. Certified partners and Strategic Development partners also get hardware system training, sales, marketing support and help in developing advanced uses for the system.

-more-

“Our developers integrated the Axxess system into our contractor management software platform in a matter of days,” commented Jeff Jones, General Partner of Acrasoft, an international developer of automated utilities. “It added value to our customer solution immediately, and Axxess’ micro-wireless system has continued to deliver automatic data reliably to meet their needs.”

The development of applications that exist today are centered around personnel, assets and vehicle solutions and include:

- Personnel Emergency Evacuation Accounting
- Service Delivery Real-Time Management
- High Speed Gate/Door Access Control
- Time & Attendance Reporting
- Asset Utilization Measurement
- Internal Zonal Security
- Trade Show Attendee Management/ Reporting
- Automated Contractor Management
- Chain of Custody Asset Tracking
- Personalized Information Delivery
- WMD Sensing and Alerting
- Combustion Sensing
- Computer Equipment Temperature Monitoring
- IT Asset Tracking
- IT Asset Protection
- Closed Loop Containers Tracking
- Document Containment
- Automated Tool Crib
- Data Storage Media Tracking
- Vehicle Access Control
- Condition Sensing
- Payload Security
- Payload Inventory Sensing and Recording
- Electronic License Plates
- Electronic Door Seal
- Bus Route Management

Dot, based on a revolutionary system-on-a-chip (SOC) technology design is the world’s smallest, most powerful, lowest cost battery-powered wireless computer. Dot’s flexibility allows it to take many forms to suit specific needs. Beyond the wireless corporate ID, Dot technology serves as the heart of many new and innovative products from Axxess such as a long range bar code, an electronic property tag, a vehicle identification tag, an electronic cargo container seal, a wireless sensor transmitter and limitless other uses.

Axxess’ invention combines a processor, memory and wireless communications into one chip about the size of a single grain of rice. It is as powerful as the first personal digital assistants (PDAs). It runs for years on a watch battery, stores at least three pages of information in memory and communicates to the world at high speed, all at a cost of only a few dollars each.

Dot solutions are based on a micro-wireless system implementation that fits seamlessly into, yet operates separately underneath, the corporate network to operate efficiently and non-disruptively. ‘Dot-ting’ the enterprise generates a real time “wireless intelligence.” Dot technology incorporates a battery powered, software definable wireless transceiver that is compatible with multiple global regulations, including the Electronic Product Code

-more-

(EPC) Class I and Gen II (passive Radio Frequency Identification [RFID]) standard and is expected to also make supply chain tagging more reliable. Dot combines the beneficial elements of today's monolithic technologies such as RFID, RTLS and wireless sensing into a single, low cost chip.

Dot is a one-of-a-kind hybrid, a single wireless source, common to multiple industry standards and supporting virtually all industries including manufacturing, the enterprise, oil and gas, utilities, education, government and the military. Memory and sensor inputs enable the Dot to be tailored to a myriad of specific data capture needs. Dot is not only a better solution for access control badges, but also a better solution for passive RFID product tags, active RFID asset tags, Real Time Location Systems (RTLS) and distributed sensor transmitters. Bringing together the new functions of Dot and building on the current Axxess micro-wireless infrastructure for enterprise management creates an open architecture for multiple sources of data to be acquired to deliver previously inaccessible business intelligence.

The active RFID and RTLS portions of Dot's capabilities are built on and are backwardly compatible with the existing Axxess 433 MHz platform, which automatically activates tags on-demand to transmit micro-wireless messages as needed from 1 to 300 feet to hidden palm-size receivers. The receivers are connected via standard network (either 802.11X wireless or wired) simultaneously to the enterprise system software and the existing security alarm equipment. Axxess' Dot system has been adopted by, is integrated with and supports several of their strategic business partners' standalone middleware and end-user software products through integration with Axxess' feature rich software platform marketed under the e-Supervisor™ label.

Interested parties can get the API by contacting Ben Donohue, VP of Business Development at Axxess International, at 972.407.6080.

About Axxess International Inc.

[Axxess International Inc.](#) (OTCBB: AXSI) delivers wireless intelligence through real-time business activity monitoring solutions that improve productivity, security and revenue growth. The systems derive wireless intelligence from automatic advanced workforce management, workflow management, asset monitoring and distributed sensing. Its revolutionary and patented Dot micro-wireless technology platform combines RFID, RTLS and wireless sensing for better decision-making and control throughout the enterprise. Axxess is a portfolio company of [Amphion Innovations plc](#) (AIM: AMP). Additional information on Axxess is available on the Company's Web site at www.axcessinc.com.
