

AXCESS introduces Enterprise Dot

AXCESS International unveiled the Enterprise Dot, a wireless, sub-micro tracking and sensing technology based on a system-on-a-chip design. The technology lets users capture, process and deliver real-time information to help supply chain visibility, mobile-asset management, physical-asset security and access control, according to AXCESS. The first product to carry the new technology will be a software-definable, battery-powered module for product manufacturers.
