

**Access launches an even smaller active RFID tag
April 5, 2007**

Access International has introduced a new, smaller wireless RFID tag designed to automatically track and protect enterprise assets. The new tag form factor has the ability to be automatically identified and located at doorways and other control points without human intervention. The new tag has been designed with the ability of attaching to even the most difficult to read metal-laden objects, such as laptops and other computer equipment. Such tags could help speed up the market's acceptance of RFID in the tagging of enterprise assets where small form factors and reliable tag reads are required.
